Reviewer's report

Title: Surgical treatment of zygomatic bone fracture using two points fixation versus three point fixation - A randomised prospective clinical trial -

Version: 1 Date: 10 November 2011

Reviewer: Obaida Rana

Reviewer's report:

It is an interesting paper on an important topic for zygomatic trauma treatment. Authors described the surgical treatment of zygomatic bone fractures using two points fixation versus three point fixation. The technological concept is interesting and the operation method seems feasible. The authors demonstrated that open reduction and internal fixation using three point fixation by miniplates was the best available method for the treatment of zygomatic bone fractures.

Otherwise a good article that merits publication after discretionary revisions. The view of English and changes should not take much time. I will be happy to recommend publication once they are in.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
