Reviewer's report

Title: Surgical treatment of zygomatic bone fracture using two points fixation versus three point fixation - A randomised prospective clinical trial -

Version: 1 Date: 16 November 2011

Reviewer: Shigehiro Ono

Reviewer's report:

The paper entitled: « Surgical treatment of zygomatic bone fracture using two points fixation versus three point fixation - A randomised prospective clinical trial - » is an interesting study demonstrating the possibility of the treatment of facial fractures. The authors demonstrated the possibility of two treatment methods by using two points versus three point fixation. The technological concept is interesting and technically seems feasible. The scientific evidence or fact of the actual cases for this technology to be usefull is described with a large number of patients.

Discretionary comments
The review of English and changes should not take more than an afternoon.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
