Reviewer's report

**Title:** A randomised controlled trial of eicosapentaenoic acid and/or aspirin for colorectal adenoma prevention during colonoscopic surveillance in the NHS Bowel Cancer Screening Programme (The seAFOod Polyp Prevention Trial): study protocol for a randomised controlled trial

**Version:** 3  **Date:** 8 July 2013

**Reviewer:** Keith Wheatley

**Reviewer's report:**

Just one small pedantic semantic point relating to the term "primary endpoint". If the authors wish to use the term to indicate the way in which they will report the outcome measure (i.e. rates will be calculated), perhaps a small section on outcome measures should be added, so that the primary outcome measure is defined as "adenoma (occurrence/presence/whatever best word is)" - then each patient is known to either have or not have adenoma and rates can subsequently be calculated.

**Level of interest:** An article of importance in its field

**Quality of written English:** Acceptable

**Statistical review:** Yes, and I have assessed the statistics in my report.
