Title: Comparison of three different dressings for partial thickness burns in children: study protocol for a randomised controlled trial

Version: 1 Date: 18 October 2013

Reviewer: Lawrence Friedman

Reviewer's report:

It is well-written and contains the key information. I have two questions for the authors. In the Data Analysis section, they say that the "data will be analysed as intention to treat and on a per protocol basis." Which of these is the primary approach?

Also, how will missing data be handled (particularly in the intention to treat analysis)?
