Reviewer's report

Title: Pneumatized superior turbinate as a cause of headache

Version: 1 Date: 9 November 2006

Reviewer: Tadashi Ishimaru

Reviewer's report:

General
Uncommon case of pneumatized superior tubinate is reported. Superior tubinate is not observed without the endoscope. Headache originated on superior tubinate is not well known. Since this report, similar cases will be reported. In the meaning of the importance as the superior tubinate originated headache, this paper is worthwhile.

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

1. Olfactory epithelium is distributed on the superior turbinate. Is there any olfactory loss after surgery?
2. Headache originated on superior turbinate is also caused by the osteoma. Discussion of the difference of headache between the pneumatized turbinate and osteoma is needed.
3. How about the inside of the pneumatized turbinate? Was there any content in it?

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

Discretionary Revisions (which the author can choose to ignore)

What next?: Unable to decide on acceptance or rejection until the authors have responded to the major compulsory revisions

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable
