Reviewer's report

Title: Non-syndromic occurrence of true generalized microdontia with mandibular mesiodens - A rare case

Version: 2 Date: 29 August 2011

Reviewer: alberto sensi

Reviewer's report:

1) the dysmorphological evaluation seems to me really needed: if specialistic examination is not available a somewhat analytical description with special emphasis in ruling out the syndromal conditions mentioned is a minimal requirement.

2) add 313490 TAURODONTISM, MICRODONTIA, AND DENS INVAGINATUS 606895 SYMPHALANGISM, DISTAL, WITH MICRODONTIA, DENTAL PULP STONES, AND NARROWED ZYGOMATIC ARCH.

3) shorten the "sporadic" and consanguinity point in discussion: "although the proband is an isolated case consanguinity could suggest recessive or polygenic inheritance.
