Title: Adenomatoid odontogenic tumor associated with odontoma: A case report and critical review of the literature

Version: 1 Date: 12 July 2013

Reviewer: Jira Chindasombatjaroen

Reviewer’s report:

Minor Essential Revisions
1. From CT images, it looks like the lesion is at the right mandible, but the authors wrote that the lesion is in the left mandible (case presentation, line 2). Please clarify the location of the lesion. If the lesion is at the left mandible, the CT images should be adjusted for the better understanding.

2. The authors have not mentioned about the history of the third molar at the lesion site. It would be better to know previous condition of the third molar because it can affect differential diagnosis. Missing? or have been extracted?

3. According to those written in the manuscript, at the time of surgery, a thin hard tissue resembling a tooth which histopathologically indicated as an odontoma was found. Does this tissue can be seen on CT images? If it can be depicted by CT images, using an arrow pointing at this odontoma on the CT images should help in radiographic interpretation.

Level of interest: An article of importance in its field
