Reviewer’s report

Title: Early loading of hydrophilic titanium implants inserted in low-mineralized (D3 and D4) bone: One year results of a prospective case report study.

Version: 1 Date: 1 September 2013

Reviewer: Tommaso Grandi

Reviewer’s report:

Major revision
- this study is not randomised and it has limited number of patients
- This is a prospective study and it should be reported according to the STROBE statement for improving the quality of observational studies (http://www.strobe-statement.org). Please rewrite Material and Methods and Results sections according to STROBE statement.

Right now, the paper is written in a confusing way.
- How did the Authors detect D3/D4 quality bone before implant placement???? What did they measure???
- Specify better all the outcomes and report estimate means and CI95% for all the outcome variables.
- How did you use a probe to detect bone loss??? The right way is to perform x-rays.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
