Reviewer's report

Title: Early loading of hydrophilic titanium implants inserted in low-mineralized (D3 and D4) bone: One year results of a prospective case report study.

Version: 1 Date: 25 September 2013

Reviewer: Raquel Castillo-Oyagüe

Reviewer's report:

This is a well-conducted and well-written paper that may be of interest for Head & Face Medicine readers. The question posed by the authors (if early loading (after 8 weeks) of hydrophilic INICELL implants is feasible in patients with reduced bone quality) is new and well defined. In general, the Methods, Results and Discussion are appropriate and well described. Nevertheless, this reviewer would like to remark the following: 1. In the abstract, the authors inform that 35 implants were used. However, in the manuscript they talk about 36. This has to be clarified and amended. 2. The statistical methods and software utilized must be included at the end of the Materials and Methods section (also in the Abstract).

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
