Reviewer’s report

Title: Applying psychological theories to evidence-based clinical practice: Identifying factors predictive of placing preventive fissure sealants.

Version: 5 Date: 8 February 2010

Reviewer: Mark Conner

Reviewer’s report:

3 minor remaining discretionary issues.
1. p. 3 spelling of Conner
2. p. 3. Weree there 5 or 6 simulations? Text says 5, questionnaire appears to show 6.
3. Implementation intentions/action control. I was unconvinced by the face validity of this measure. My advice would be to remove this from the manuscript. It does not represent a good test of this construct. Indeed some would argue that it is a manipulation not a predictive measure.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
