Reviewer’s report

Title: Measurement of a model of dissemination for health care: Toward a testable theory

Version: 3 Date: 18 April 2012

Reviewer: Jill Francis

Reviewer’s report:

I appreciate the authors’ attention to the earlier comments of the reviewers. The revised manuscript addresses these and presents a clear and helpful account of the rationale, findings and implications of this research for enhancing implementation research.

Minor essential revisions

I am sorry, but I still feel that the Results section of the Abstract does not present the results that are reported in the paper. The first (long) sentence appears to present further information about the methods. I think it would help readers if this sentence could be replaced with text to the effect that the review identified three types of data that have been used to operationalise the constructs in the model: questionnaire items, interview questions, and administrative data, and that specific examples of these are reported.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:

I declare that I have no competing interests.
