Reviewer’s report:

I read the article with interest, the authors could have provided more literature about malposition of chest tube to various locations. It would have been nice to include morbidity and the final outcome of the patient.

There are few spelling mistakes “it presents in many ways”, inadvertent entry of chest tube into jejunal loop which could have been rectified. Overall this case report is a learning exercise for all of us and stresses the need for looking at the contents of the chest bag always.

Level of interest: An article of importance in its field
