Reviewer's report

Title: Postoperative peri-axillary seroma following axillary artery cannulation for surgical treatment of acute type A aortic dissection

Version: 1 Date: 10 May 2010

Reviewer: FANY CHRONIDOU

Reviewer's report:

A very interesting article about a quite unusual post-operative complication. This approach is in common use in cases of aortic aneurysm where arch is involved. The key in the treatment of this complication remains the differentiation between seroma and lymphocele.

Level of interest: An article of importance in its field
