Reviewer's report

Title: Dangerous Drug Interactions leading to Hemolytic Uremic Syndrome following Lung Transplantation

Version: 1 Date: 15 July 2010

Reviewer: Panagiotis Dedeilias

Reviewer's report:

Tacrolimus induced haemolytic-uremic syndrome is a rare but nearly fatal medical entity. Requires immediate response, rearrangement of medical treatment and even plasmapheresis in some cases. The paper is worth a publication. It will remind this hazardous drug side effect to all medical officers related to heart/lung transplant programmes. However it requires major language and structural improvement before its final publishing form.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published
