Title: Long term follow up results of sequential left internal thoracic artery graft on severe left anterior descending artery disease

Journal: Journal of Cardiothoracic Surgery

I read with great interest the paper entitled "Long term follow up results of sequential left internal thoracic artery graft on severe left anterior descending artery disease". The authors present long term results of sequential LAD revascularization with LIMA. The revascularization of severely diseased LAD is debatable issue and different authors may prefer different techniques. Although the same revascularization procedure is frequently performed at our institution, even with triple sequentials to the LAD, since we did not have the long term results, the data have not been published yet. On the other hand, we had long term data of long segment LAD reconstruction with LIMA graft and published the paper in the past years. However, authors should be congratulated for their valuable contribution to the field and I believe the paper of the authors may be leading article in this particular topic. We will definetely update our clinical series and obtain the results from our patients and compare the results. I only have a few minor comments. Although the figure is informative, a better quality picture and some more figures may be helpful for the readers (not a must but can be good). Additionally article contains minor language errors and should be checked for typos. Once again, I congratulate the authors.

Level of interest: An article of outstanding merit and interest in its field

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
