Reviewer’s report

Title: Impact of repeated percutaneous coronary intervention on long-term survival after subsequent coronary artery bypass surgery

Version: 1 Date: 2 April 2011

Reviewer: Vipin Zamvar

Reviewer’s report:

The authors have described the negative consequences of multiple percutaneous interventions in patients who subsequently need coronary artery surgery.
This should be kept in mind when discussing treatment options with patients who need coronary revascularisation.
The recent European guidelines on coronary revascularisation rely on best available evidence to suggest different treatment options of various types of coronary artery disease.
The authors must include these guidelines in their discussion.

Level of interest: An article of outstanding merit and interest in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
