Reviewer’s report

Title: Carney-Complex: Multiple resections of recurrent cardiac myxoma

Version: 3 Date: 27 January 2011

Reviewer: York Zausig

Reviewer's report:

Bireta and colleagues present a well written and interesting case report of a rare syndrome, the Carney Complex, which is characterized by multiple symptoms with significant clinical relevance.

Major comments:
1. There is still the confusing discussion about the NAME- and the LAMB-syndrome and their relation to the Carney complex. I would suggest that the authors should shortly discuss this important issue in the discussion section.
2. It seems that another 3 years have passed by since the last operation. Did you follow up the clinical course of the patient? What does the latest echocardiography show?
3. Is it possible to distinguish between operation and Carney complex related relapse of the myxoma? Please explain.

Minor comments:
Page 2, line 16: Please delete “cardiological”.
Page 2, line 23: This sentence makes no sense to me. Please change.
Please check the entire manuscript again for grammar and orthography, e.g.
Page 3, line 12: “in” is missing.

Level of interest: An article of importance in its field

Quality of written English: Needs some language corrections before being published
