Title: Non Infective Severe Aortic Paraprosthetic Leakage 7 Years After Surgery: The Role of Suture Technique.

Version: 1 Date: 8 February 2011

Reviewer: Faisal Habib Cheema

Reviewer's report:

This is a case report focusing on the non-infective nature of the severe aortic paraprosthetic leakage following a non-continuous suture technique. It is an interesting paper but the message which authors are trying to convey does not get across completely due to an unstructured and somewhat incoherent writing style. The paper could utilize a review and perhaps rewriting in part from a native English speaker. I'd accept this paper but with extensive revisions.

- The abstract needs to be more crisp.
- The introduction is confusing especially if you read the first 2 sentences they do not make any sense, rather they are contradictory in nature. They just need to be rewritten to convey the clear message.
- The "first aid of our hospital" instead of "emergency room" and "the pericardial adherences were hardly dissected" instead of "pericardial adhesions were hard to be dissected" reflects the extensive language improvement for this paper. The meanings are totally reversed with incorrect sentence structure as listed above.

Please instruct the authors to rewrite and resubmit the paper.

Level of interest: An article of limited interest

Quality of written English: Not suitable for publication unless extensively edited
