Reviewer’s report

Title: A rare case of anomalous origin of the left main coronary artery in an adult patient

Version: 1 Date: 7 September 2012

Reviewer: Jean-Francois Legare

Reviewer’s report:

Well written manuscript
Interesting case but it was unclear to this reviewer how the management or the case fits in what is already available from the literature.

Suggested major revisions:
1) comment and expand on how the management of this patient differs from the several case reports seen in the literature
2) highlight the novelty of the present case report when compared to previous reports
3) given the choice of SVG for revascularization some additional data would greatly help the present manuscript
   -flow data on the graft done and discussion on the potential impact of extensive collaterals
   -follow-up stress test or imaging
4) discuss how this patient may have survived into his 40's without significant myocardial damage
5) discuss potential sacrifice on longevity of using SVG

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable
