Reviewer's report

Title: A rare case of anomalous origin of the left main coronary artery in an adult patient

Version: 1 Date: 9 September 2012

Reviewer: Bob Kiaii

Reviewer's report:

The authors should be congratulated in reporting such an interesting and rare anomaly. My only question would be for the authors to elaborate further on the reasoning for choosing saphenous vein graft as a conduit of choice in this young 48 year old patient and not the left internal thoracic artery (LITA). I do not understand their explanation. Since this individual does not have evidence of coronary artery disease, the utilization of LITA, would not have created inadequate flow in the left anterior descending coronary artery. Also they should explain why they did not consider an interposition arterial graft with end to end anastomosis between the aorta and the left main artery.
