Reviewer’s report

**Title:** Massive pulmonary embolism secondary to longstanding traumatic femoropopliteal pseudoaneurysm associated with arteriovenous fistula

**Version:** 2  **Date:** 29 November 2013

**Reviewer:** P Nemec

**Reviewer’s report:**

Minor Essential Revisions

There are several abbreviations in the paper, they should be explained

p. 4, line 1 – b/m is usually used for heart rate and not for respiration frequency

line 2 – oxygen saturation is measured in % and not in mmHg

p. 5 – name “aneurysm” and “pseudoaneurysm” are used simultaneously for the same structure. Since these pathological entities have different nature only one of these should be used

p. 7 at the bottom – the cause of pseudoaneurysm is not “degenerative changes in the arterial wall” but more probably the injury of the wall by the bullet

**Level of interest:** An article of importance in its field

**Quality of written English:** Needs some language corrections before being published
