Reviewer's report

Title: Bronchial obstruction secondary to idiopathic scoliosis in a child.

Version: 7 Date: 27 March 2008

Reviewer: gregory mencio

Comments to authors:

I have reviewed the manuscript and feel that in the current version the authors have addressed all points listed in the reviewers' comments. The legend accompanying figure 1 is helpful to understand the Pulmonary function data. An arrow would be helpful to show what the authors are referring to when they describe the "scoping and concavity" in the expiratory part of the flow volume curve (not all who read this will have pulmonary background.) In the conclusion, the authors state that direct visualization with a flexible bronchoscope in patients with obstructive findings might be helpful to "guide further management", which begs the question, "Such as what?" Perhaps they could expand on that. Otherwise I feel this manuscript is suitable for publication.
