Title: A new technique for treatment of non united fracture of Humerus in a patient with osteopetrosis a Case Report

Version: 2 Date: 22 July 2008

Reviewer: Giuseppe Porcellini

Comments to authors:

Thank you for submitting your interesting and challenging case report.

Given the fact that osteopetrosis is not a common disease, managing patients affected by this genetic condition is not easy, even in this case in which a standard surgical technique was performed to achieve stable fixation and non-union healing.

Despite the fact that is difficult to demonstrate that BMP plays a crucial role in stimulating osteoblast differentiation, being a disease characterized by altered expression of genes involved in osteoblast differentiation itself, we believe that this manuscript is suitable for publication on the Journal of Medical Case Report.
