Reviewer's report

Title: Primary tubercular liver abscess in an immunocompetent adult: a case report

Version: 2 Date: 14 November 2008

Reviewer: Shashi khare

Comments to authors:

1. Case report seems to be of sufficient scientific interest.

2. However, following clarifications are needed:
   · What was the drug sensitivity profile of the mycobacterial isolate obtained?
   · How was the isolate identified as mycobacterium tuberculosis i.e. was it by doing NAP test or Niacin test?
   · The procedural details of the PCR test need to be described in terms of :
     a) Nature of the target DNA sequence amplified.
     b) The genetic sequence of the primers used in the PCR test.
     c) Method of extraction of DNA used in the test.
     d) What was the Amplicon size in terms of bp?
