Title: Tako-tsubo cardiomyopathy after administration of ergometrine and subsequent caesarean delivery: a case report

Version: 2 Date: 1 December 2009

Reviewer: Yun Wong

Comments to authors:

-This report appears to be authentic and interesting.
-It discusses a condition which is currently not well known, and its potential presentation
-Grammatically there are a few errors in the report and I believe it may be beneficial for the authors to correct these.
-I feel it would be appropriate to document any further blood test results or investigations ie U+E and US kidney to rule out flash pulmonary oedema from renal artery stenosis.
-In the conclusion, the authors need to show more appreciation for the release of catecholamines during child birth.
-There does not appear to be any ethical issues
-This is overall a well written study and should be published
