Reviewers report

Title: Toxoplasmosis presenting with a breast mass and a palpable axillary lymph node mimicking malignancy. A case report.

Version: 1 Date: 24 December 2010

Reviewer: AMS Abeysekara

Which of the following best describes what type of case report this is?: Unexpected or unusual presentations of a disease

Has the case been reported coherently?: Yes

Is the case report authentic?: Yes

Is the case report ethical?: Yes

Is there any missing information that you think must be added before publication?: No

Is this case worth reporting?: Yes

Is the case report persuasive?: Yes

Does the case report have explanatory value?: Yes

Does the case report have diagnostic value?: Yes

Will the case report make a difference to clinical practice?: Yes

Is the anonymity of the patient protected?: Yes

Comments to authors:

This is a good case report about a rare interesting clinical scenario. The case is presented clearly.

Suggest following changes in the text.
1) Toxoplasmosis instead of Toxoplasma lymphadenitis in the conclusion (page 2 - abstract and page 8)
2) acute infection with Toxoplasma gondii instead of acute acquired infection with Toxoplasma in the introduction (page 3). 

Is there any relevance of reference 8 (i.e. molecular biology in the diagnosis of Toxoplasmosis) to this case?
Quality of written English: Needs some language corrections before being published
