Dear, Professor Michael Kidd AM

The enclosed manuscript, "Tetanus developed after replantation of an amputated finger: case report" is being submitted for consideration of publication in your journal. In traumas with exposure of the finger nerves and blood vessels, such as in this case, irrigation and debridement may be insufficient, for which attention should be paid to the development of tetanus.

We think this original case report will be of interest to all surgeons. We believe this case is the first report in the literature and advances our understanding of trauma.

Our report is an unexpected event in the course of observing or treating a patient.

If you have any questions or comments about our manuscript, please contact me by e-mail. I will be happy to respond.

Sincerely,

Kenji Hayashida MD.

Department of Plastic and Reconstructive Surgery, National Nagasaki Medical Center.
