Reviewer's report

**Title:** An unusual case of metastasis of a pulmonary undifferentiated pleomorphic sarcoma to the right ventricle: a case report

**Version:** 4  **Date:** 10 April 2013

**Reviewer:** Keith Buchan

**Comments to authors:**

I have read the revised manuscript and it nows reads well and comes over as a credible account. I note that the patient only had 6 months of follow-up at the time of submitting this article following resection of the cardiac metastasis. It is Cardiothoracic surgical dogma that these tumours are incurable and that they always recur, usually within 1-2 years of the original cardiac operation. Cardiac transplantation has been carried out for this condition, but even that procedure is only palliative. As it stands, the article gives the impression that their patient might do well in the long term. It might be more helpful to include a statement about the poor long term prognosis in this group of patients.
