Reviewer's report

Title: Myelin associated glycoprotein (MAG) related neuropathy associated with Psoriasis: a case report

Version: 1 Date: 5 October 2012

Reviewer: Mark Kuijf

Which of the following best describes what type of case report this is?: An unexpected association between diseases or symptoms

Has the case been reported coherently?: Yes

Is the case report authentic?: Yes

Is the case report ethical?: Yes

Is there any missing information that you think must be added before publication?: Yes

Is this case worth reporting?: Yes

Is the case report persuasive?: Yes

Does the case report have explanatory value?: Yes

Does the case report have diagnostic value?: No

Will the case report make a difference to clinical practice?: Yes

Is the anonymity of the patient protected?: Yes

Comments to authors:

This case report is well written and proposes an association between psoriasis and an anti-MAG polyneuropathy. The author's describe their considerations with regard to the therapy given to the patient well, however some additional information could be discussed that makes the case report more complete. First, I would like to know why the author's suggest that the two diseases are linked and worth reporting. Why do the author's think, or not, that the diseases are linked? In addition, anti-MAG polyneuropathy is difficult to treat. IVIg is not a standard therapy given for these patients and the small clinical trials that have been reported show no convincing effect, other than the short-term. Can the author's add a note on this and on the period of effectiveness?
