Reviewer's report

**Title:** A postoperative neurological aggravation with sevoflurane in patient with Xeroderma Pigmentosum: a case report.

**Version:** 6  **Date:** 22 November 2012

**Reviewer:** PJ Brooks

**Comments to authors:**

In my view, it is difficult to draw any firm conclusions from this report. While some XP patients do in fact have a neurodegenerative disease phenotype, it is not clear to me that this patient is one of them. Also there is no information about the mutations or the patients complementation group that would be useful to have. Finally, the patient was given many different drugs, it's hard to point specifically to one as being a potential cause.
