Reviewer’s report

**Title:** A Supratentorial Primitive Neuroectodermal Tumor presenting with Intracranial Hemorrhage in a 42-year-old male: Case Report and Literature Review

**Version:** 2  **Date:** 5 September 2012

**Reviewer:** Apostolos Karantanas

**Comments to authors:**

**General comments:**

The case is interesting as it is rare to meet such tumors in adults, particularly presenting with acute parenchymal hemorrhage. Thus the information delivered, will substantially help clinicians and radiologist to include this possibility in the differential diagnosis of a common problem in the emergencies, ie brain hemorrhage. The figures are authentic, there is no ethical issue to be raised appart from the

**Specific comments:**

Abstract: The term PNET mentioned in the conclusion, has not been defined previously. This can be in the introduction section.

English needs improvement, ie last sentence page 3: An emergent brain computer tomography (CT) was performed ..... instead of a brain computed tomography (CT) scan was performed on an urgent basis. This improvement should be done by a native English speaker who should screen carefully the manuscript.

The authors report that written informed consent was obtained from the patient for publication of this case report and accompanying images. Do they mean relatives of the patient?
