Reviewer’s report

Title: A Supratentorial Primitive Neuroectodermal Tumor presenting with Intracranial Hemorrhage in a 42-year-old male: Case Report and Literature Review

Version: 2 Date: 18 September 2012

Reviewer: R. Webster Crowley

Which of the following following best describes what type of case report this is?: Unexpected or unusual presentations of a disease

Has the case been reported coherently?: Yes

Is the case report authentic?: Yes

Is the case report ethical?: Yes

Is there any missing information that you think must be added before publication?: No

Is this case worth reporting?: Yes

Is the case report persuasive?: No

Does the case report have explanatory value?: No

Does the case report have diagnostic value?: No

Will the case report make a difference to clinical practice?: No

Is the anonymity of the patient protected?: Yes

Comments to authors:

This case report describes the unusual presentation of a supratentorial PNET which presented in adult with hemorrhage. The case report is well written. There are, however, a few issues that should be remedied before publication. First, the conclusions are not supported by the manuscript. Namely, the authors can not make a statement regarding the prognostic value of ki-67 based on the case report presented. In addition, the authors suggest that the fact that outcomes are poor from a massive ICH due to a PNET is unique, however massive ICH is associated with poor outcome regardless of etiology.
