Reviewer's report

Title: Generalized tonic-clonic epilepsy and asymmetrical lateral ventricles in a patient with 45,X0/46,XX/47,XXX mosaic Turner syndrome

Version: 1 Date: 17 November 2013

Reviewer: Fabio Placidi

Which of the following best describes what type of case report this is?: Unexpected or unusual presentations of a disease

Has the case been reported coherently?: Yes

Is the case report authentic?: Yes

Is the case report ethical?: Yes

Is there any missing information that you think must be added before publication?: No

Is this case worth reporting?: Yes

Is the case report persuasive?: No

Does the case report have explanatory value?: Yes

Does the case report have diagnostic value?: Yes

Will the case report make a difference to clinical practice?: Yes

Is the anonymity of the patient protected?: Yes

Comments to authors:

The authors describe an unusual case of Turner Syndrome (TS) affected by epilepsy. They conclude that epilepsy is not infrequent in TS.

The paper is well written, clear and interesting.

I have only not minor comments.

1) It would be interesting to add in the figure 2 the T1-weighted Inversion Recovery sequences

2) pg 6 line 12: „ „neurological examination were essentially normal; please change “were” with “was”

Quality of written English: Needs some language corrections before being
published
