Reviewer's report

Title: Elevated brain aluminium and early onset Alzheimer's disease in an individual occupationally exposed to aluminium.

Version: 1 Date: 10 December 2013

Reviewer: Romain Gherardi

Which of the following best describes what type of case report this is?: Findings that shed new light on the possible pathogenesis of a disease or an adverse effect

Has the case been reported coherently?: Yes

Is the case report authentic?: Yes

Is the case report ethical?: Yes

Is there any missing information that you think must be added before publication?: No

Is this case worth reporting?: Yes

Is the case report persuasive?: Yes

Does the case report have explanatory value?: Yes

Does the case report have diagnostic value?: No

Will the case report make a difference to clinical practice?: Yes

Is the anonymity of the patient protected?: Yes

Comments to authors:

This is a concise and convincing case of AD occurring in a man professionally exposed to Al, associated with well documented Al accumulation in the brain. Search for co-localization of Al deposits and neuropathological alterations (senile plaques, DNF) would have been contributory.

Quality of written English: Acceptable
