Title: Successful anti-disseminated intravascular coagulation therapy and vaginal delivery following intrauterine fetal death due to placental abruption: a case report

Version: 2
Date: 4 September 2014
Reviewer: elvira grandone

Which of the following following best describes what type of case report this is?: Other

If other, please specify:

The paper sheds light on the management of disseminated intravascular coagulation after a rare complication of pregnancy, placental abruptio.

Has the case been reported coherently?: Yes

Is the case report authentic?: Yes

Is the case report ethical?: Yes

Is there any missing information that you think must be added before publication?: Yes

Is this case worth reporting?: Yes

Is the case report persuasive?: Yes

Does the case report have explanatory value?: Yes

Does the case report have diagnostic value?: Yes

Will the case report make a difference to clinical practice?: Yes

Is the anonymity of the patient protected?: Yes

Comments to authors:

Honda and coll describe the case of a 37 yrs old patient, who developed an intravascular disseminated coagulation after a fetal death following placental abruptio.

I have only few questions:
- Was the patient studied for inherited and acquired causes of thrombophilia?
- Did she show other risk factors for the development of obstetric complications?
- Was a personal or familial history of venous thromboembolism reported?

**Level of interest:** An article of importance in its field

**Quality of written English:** Needs some language corrections before being published
