Reviewer's report

Title: Association of laryngeal and nasopharyngeal tuberculosis: a case report.

Version: 2 Date: 24 October 2014

Reviewer: Masafumi Ohki

Which of the following following best describes what type of case report this is?: Unexpected or unusual presentations of a disease

Has the case been reported coherently?: Yes

Is the case report authentic?: Yes

Is the case report ethical?: Yes

Is there any missing information that you think must be added before publication?: Yes

Is this case worth reporting?: Yes

Is the case report persuasive?: Yes

Does the case report have explanatory value?: Yes

Does the case report have diagnostic value?: Yes

Will the case report make a difference to clinical practice?: No

Is the anonymity of the patient protected?: Yes

Comments to authors:

This is a rare case report of pharyngolaryngeal TB. But there are several points to revise for publication, as follows;

In observation, there are no findings and no symptoms of nasal TB. Nasal cavity was intact?

In abstract and introduction, ‘rhinopharyngeal’ should be ‘nasopharyngeal’.

This report is about pharyngolaryngeal TB which is rare, but has been reported a few times.

I think that laryngeal TB is not common as a primary site but is still rare to date. Are there any data about morbidity rate of primary laryngeal TB?
Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable
