Reviewer’s report

Title: Exploring the oral microbiota of children at various developmental stages of their dentition in the relation to their oral health

Version: 1 Date: 5 January 2011

Reviewer: Didier Raoult

Reviewer’s report:

This is a MS reporting on the molecular study of oral microbiota. It is extremely confusing as too many groups were studied and as the authors did not succeed in linking their data to any significative findings. Moreover this model of post oc analysis with so many data always identify a factor that need to be confirmed on a second group to be validated prospectively.
