Reviewer’s report

Title: Intra-articular corrective osteotomy for malunited Hoffa fracture: a case report

Version: 1 Date: 17 July 2011

Reviewer number: 1

Reviewer’s report:

1. There were no X-rays of pre- and post-first operation. Depression of lateral condyle seems to be necrosis after Hoffa fracture. Is it really malunion of fracture?

2. After osteotomy, does the lateral condyle become normal size? It looks not corrective osteotomy but downsizing osteotomy.
