Reviewer's report

Title: Challenges in the management of a patient with Cowden syndrome: case report and literature review

Version: 1 Date: 3 January 2012

Reviewer: Aleksandra Toclozko-Grabarek

Reviewer's report:

Interesting case report of patient with diagnosis of Cowden syndrome. Clinical diagnosis is confirmed with detection of mutation in PTEN gene. Introduction contains sufficient knowledge about the syndrome. Case presentation is described precisely, as well as options of medical management. However I have minor comments. The authors write on page 6 that molecular examination was performed also in proband's father and was negative. Was proband's mother examined? It would be helpful to introduce into the manuscript the pedigree of whole family including cancer family history. Phrases as "as yet" should be replaced with more fortune in this context "so far". Native speaker should read the manuscript.

Level of interest: An article of importance in its field
