Reviewer’s report

Title: The role of Wnt signaling pathway in carcinogenesis and implications for anticancer therapeutics

Version: 1 Date: 26 January 2014

Reviewer: Rodney J. Scott

Reviewer’s report:

Major Compulsory Revisions: The subject matter the authors discuss is complex and can be difficult to follow. To help readers (who may not have much knowledge about the Wnt signalling pathway) understand the complexity of this signalling pathway it is necessary to put a pathway figure into the manuscript. It should also be stressed that perturbations of the Wnt signalling pathway in normal cells can be lethal and as such it has been difficult to identify yet alone design specific inhibitory markers that could act on affected cells alone. I would therefore like to see a statement to this effect.

Minor Essential Revisions: Ensure that all grammatical errors are corrected.

Level of interest: An article of importance in its field

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:
