Reviewer’s report

**Title:** Rosacea-like facial rash related to metformin administration in a young woman

**Version:** 2  **Date:** 24 December 2013

**Reviewer:** Antonello A Di Paolo

**Reviewer’s report:**

In their manuscript, Mumoli and colleagues described a case report of facial rash associated with the administration of metformin in a young woman. The paper shows as an incorrect diagnosis may promptly lead to a prescribing cascade (and this is the major important aspect of the paper). However, the rosacea-like rash is interesting because metformin technical note reports itch and hives, but not this kind of dermatological ADR.

In the opinion of the Reviewer, no further revision is required

**Level of interest:** An article of importance in its field

**Quality of written English:** Acceptable

**Statistical review:** No, the manuscript does not need to be seen by a statistician.
