Title: Highly Active Antiretroviral Therapy and Dyslipidemia in people living with HIV/AIDS in Fako Division, South West Region of Cameroon

Version: 1 Date: 22 July 2015

Reviewer: franck Boccara

Reviewer's report:

Comments
1- Why the authors used the term proatherogenic LDL in the abstract? This should be defined.
2- Patients under statins were excluded from this study. This should appear in the abstract.
3- The method of blood collection is not needed in the abstract
4- Lopinavir and not lapinavir line 78
5- Line 80 to 85. The authors should precise which group all group for the first part and treated group last part
6- The authors should comment the very surprising data that the CD4 cell count was not different between the HAART naïve and HAART group? How could you explain this? Usually ART naïve patients are found lately with immunodepression....
7- Line 146 70.2% is quite similar to 64.3%
8- There are too much tables. Tables 4, 5 and 6 should be suppressed. Tables are not clear. Table 1 should be shortened without any description of months categories for HIV and HAART durations.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
