Reviewer's report

**Title:** Prevalence and characteristics of coronary artery anomalies in an adult population undergoing multidetector-row computed tomography for the evaluation of coronary artery disease.

**Version:** 2  
**Date:** 8 February 2015

**Reviewer:** Matteo Bianco

**Reviewer's report:**

The paper is based on a retrospective study on a consecutive population of 2572 patients who underwent coronary multidetector-row computed tomography. Others studies already evaluated CAA in different populations with coronary CT-scan. Anyway, the study is well designed and the data sounds.

In my opinion some informations about statistic are needed.

The reasons why the patients underwent CT-scan vary widely. In my opinion could be useful to define better the clinical characteristics and the symptoms complained by the patients among which CAA was found.

**Level of interest:** An article of importance in its field

**Quality of written English:** Acceptable

**Statistical review:** Yes, and I have assessed the statistics in my report.
