Reviewer’s report

Title: Surface ECG interatrial block-guided treatment for stroke prevention: Rationale for an attractive hypothesis

Version: 0 Date: 28 Jun 2017

Reviewer: Cristina Balla

Reviewer's report:

The authors describe an interesting hypothesis about the correlation of interatrial block and stroke prevention. They suggest the possibility to use the P wave duration and morphology as a marker of atrial fibrillation and the need of anticoagulation to prevent stroke. I would expand more in depth the discussion to support this interesting hypothesis.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Unable to assess

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Unable to assess

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

No

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.

Not relevant to this manuscript
