Reviewer's report

Title: Outcome of gastric emptying and gastrointestinal symptoms after liver transplantation for hereditary transthyretin amyloidosis

Version: 1 Date: 23 January 2015

Reviewer: Mehmet Haberal

Reviewer's report:

There are some limitations related with the manuscript entitled as ‘Outcome of gastric emptying and gastrointestinal symptoms after liver transplantation for hereditary transthyretin amyloidosis’

1- When we evaluate the ‘T50’ measurements seperately before and after scintigraphic software differences is there any difference between the results?

2- Although we do not expect a significant symptomatic amelioration after transplantation and evaluation of symptoms is a subjective thing, the comparison of symptoms in accordance different time periods will increase the subjectivity of your comment.

3- I noticed that not all the patients responded the survey and it is possible that patients with complaints are more prone to respond the survey.

4- On the other hand it is not clear how a person can get 4 and 6 points from lower GI symptoms which consists of from three symptoms (192-193)

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
