Reviewer's report:

Relationships between falls, vertebral fractures, increased kyphosis and a flexed posture in elderly: A prospective cohort study
Van der Jagt-Willems et al.

Major Comments
As I suggested in my previous review, my main concern was related to the number of participants that is too short to draw relevant conclusion. Unfortunately the new version is not strongly different compared with the previous one. Particularly the number of patients is exactly the same. I maintain that the subject if interest but the number of patients should be increased for drawing relevant findings. I think that the inclusion of 100 subjects should be sufficient.
