Reviewer's report

Title: Measles vaccine coverage estimates in an outbreak three years after the nation-wide campaign in China: implications for measles elimination, 2013

Version: 1 Date: 12 November 2014

Reviewer: Elisabeth Botelho-Nevers

Reviewer's report:

The manuscript was overall improved. However, it is too long for a message that is quite simple: there is a gap between reported measles immunization coverage and estimated coverage using 5 different methods. For example, methods section is very long and should be shorten.

Despite being interesting this message of this study has little value as it is only applicable to a region of China.

I therefore strongly suggest shorten the manuscript (e.g. brief report)

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
