Minor revisions:
The detection rates of human rhinoviruses and coronaviruses presented in this study are very different than other studies realized in China and previously published (Ju X. et al, Arch. Virol. 2014, Qin Hu et al PLoS One 2014, Zhang et Intern JID 2014 and Lu QB et al. J Med Microbiol 2014). In recent months, many studies are realized in China to explore the detection of viral etiologies of CAP. However, the authors discuss the results with a published review. The comparison of results obtained in this study with the other studies realized in China with same population is needed for the good appreciation of the work.

To facilitate the understanding of readers, could the authors present a list of abbreviations?
