Reviewer’s report

Title: Multifocal skeletal tuberculosis in an immunocompetent patient: a case report

Version: 2 Date: 12 April 2015

Reviewer: Isdore Chola Shamputa

Reviewer’s report:

The authors of this article present a case with multifocal skeletal involvement of tuberculosis in an immunocompetent individual with chronic disabling joint pain without other common symptoms of tuberculosis such as fever, weight loss, or coughing. This is an important study that encourages consideration of tuberculosis in the differential diagnosis of multiple destructive skeletal lesions particularly in situations where its involvement may not be anticipated. The article is well written and presented. I have no concerns about this manuscript.

Major Compulsory Revisions: None
Minor Essential Revisions: None

Level of interest: An article of outstanding merit and interest in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
