Reviewer’s report

Title: A dual regimen of ritonavir/darunavir plus dolutegravir for rescue or simplification of rescue therapy: 48 weeks' observational data

Version: 0 Date: 17 Aug 2017

Reviewer: Renato Maserati

Reviewer's report:

This update of a previously published observational study (48 wks) may shed some additional light on the use of boosted darunavir plus dolutegravir as ARV therapy in patients with a previous exposure to ARVs. However, the case file -as acknowledged by the Authors- includes very different types of patients and motivations to start this combination. The dosage of both drugs is not given in detail (it is only stated that a small number of them used one of the two drugs in a bid fashion). The reference sections needs to be updated at least for the paper cited as no.1

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Yes

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
